Instructions and information:

- Please turn off cell phones or any other thing that will go BEEP.
- You are allowed to use your textbook
- Read the directions for each problem.

1. (5 points each) Find the number of ways to distribute all 30 books to 10 libraries in each situation.
 - (a) Assume the books are distinct and the libraries are distinct and there are no restrictions on where the books go.
 - (b) Assume 5 of the 30 books are identical and that these 5 books should go to different libraries, but there are no other restrictions.
 - (c) Assume all 30 books are identical and every library should get at least one book.
 - (d) Assume all 30 books are distinct and each library will receive exactly three books.

2. (10 points) How many numbers must be chosen from the set $\{1, 2, 3, 4, 5, 6, 7, 8\}$ to guarantee that at least one pair of these numbers adds up to 9? You must prove your answer is correct. (Hint: Use the Pigeon Hole Principle)

3. (10 points) Give a combinatorial proof that $\sum_{i=1}^n i \binom{n}{i} = n2^{n-1}$ for all positive integers, n .

4. (10 points) Let \mathcal{C} be a q -ary code with codewords of length n . (So \mathcal{C} is a subset of all n -length words using the alphabet $X = \{0, 1, 2, \dots, q-1\}$.) As with the Hamming distance on binary words, assume that the distance between two q -ary words is the number of positions in which the two words differ. Prove that if code \mathcal{C} can correct up to e errors, then

$$|\mathcal{C}| \leq \frac{q^n}{\sum_{i=0}^e \binom{n}{i} (q-1)^i}$$

5. (15 points) Theorem 7.2.4 (page 288) says that if \mathcal{D} is a symmetric BIBD with parameters (v, k, λ) , then \mathcal{D}' , the derived design obtained from \mathcal{D} , has parameters $(v-1, k, k-1, \lambda, \lambda-1)$.
- (a) Explain directly (not using the other parameters of \mathcal{D}') why the derived design has $v-1$ blocks.
- (b) Explain directly (not using the other parameters of \mathcal{D}') why the derived design is λ -regular.

6. (15 points) Define a partially ordered set $P(X, R)$ where $X = \{1, 2, 3, 4, 5, 6, 7, 8\}$ and for all $a, b \in X$, $(a, b) \in R$ if and only if $a \mid b$.

(a) Draw the Hasse Diagram for P .

(b) Find all maximal elements of P .

(c) Find the meet of 4 and 6 (i.e. $4 \wedge 6$) and show that 4 and 6 have a lower bound distinct from $4 \wedge 6$.

(d) Find a maximal chain in P that is not a maximum chain.

7. (15 points)

- (a) Give ONE example of a partition of 40 into 3 parts.

- (b) Give ONE example of a partition of 40 into 3 parts each of which is an even number (i.e. a partition with even parts)

- (c) Give TWO examples of a partition of 40 into even parts each of which is at most 8.

- (d) Express the number of partitions of 40 into even parts each of which is at most 8 as a suitable coefficient of a certain generating function. (That is, you must specify a generating function and a coefficient of the generating function.)

-
8. (10 points) Show that if $\delta(G) \geq k$ then G must contain a cycle on at least $k + 1$ vertices.
